

Human Niche Construction and Hydrology

Maurits Ertzen

Delft University of Technology, Department of Water Management, Delft, Netherlands (m.w.ertzen@tudelft.nl)

The poster will introduce Human Niche Construction Theory to clarify the capacity of organisms to modify their environment and thereby influence their own and other species' evolution. HNC allows building a recursive relationship between long-term human actions and landscape modification. Discussing the concept will also allow studying why we should understand societal collapse in new ways and whether policies towards sustainability will have a potential for success.
