

## Review of Calcareous Nannoplankton Investigations

(carried out 1964/72 in connection with the Vienna UNESCO Postgraduate Training Center)

(1 table, 1 plate)

By H. KÜPPER & H. STRADNER

In the years since 1950 contributions on the calcareous nannoplankton were building up fields of research of increasing importance for geosciences. Today they are indispensable as quick tool for stratigraphic investigations of deep sea cores and also as an independent check for age determinations of mesozoic and cenozoic rocks, next to the classical methods of stratigraphy.

Scientific and laboratory facilities in this field were made available to those members of our courses, who wanted to acquaint themselves with this field of study. Moreover a general introduction into this topic was part of the normal programme for all course participants. As for the time being our course venture comes to a conclusion, we like to underline in the following a few facts, which we consider as relevant to be handed on.

The very fact, that nannoplankton stratigraphy was new and is opening new possibilities to approach sample material, which so far has resisted yielding any clues as to its age assignment, was a bond which brought together investigators from Korea, India, Egypt, Argentine on the basis of a common scientific zeal. As seen from the UNESCO-point of view here a basis of transcontinental dimensions was offered by these ultra-minute fossils, which thus promoted common understanding even beyond the science field.

Naturally nannoplankton investigations developed rapidly during the years of our courses in the international field. The ideas of 1970 are different and better documented than those of 1960. Conferences and symposia were marking this progress, thus opening for participating investigators the door to international cooperation and worldwide contacts. This gateway to new scientific and human realms was, what made it highly attractive for teachers and students.

Norwithstanding that in recent years electron microscopy and scanning techniques became desirable working methods, the very roots of the working techniques remained relatively uncomplicated. And this again resulted in a wide and quick dissemination in some countries, where the first steps in this working field were introduced successfully. In this respect we may refer to our colleagues from Egypt, where quite a flow of stratigraphical investigations resulted in new views as to correlations and subdivisions, which before had to be based on less certain considerations.

## RANGE-CHART OF NANNOFOSSIL INVESTIGATIONS

1965 / 72

Paleocene					Eocene						approx. age of samples studied	Author and date of publication							
Lower		Middle	Upper	Lower	Middle	Upper													
P 1	P 2	P 3	P 4	P 5	P 6	P 9	F 10	F 9	F 8	F 7									
NP 1	NP 2	NP 3	NP 4	NP 5	NP 6	NP 7	NP 8	NP 9	NP 10	NP 11									
Danian																			
Maastrichtian																			
													NP 18	<i>Chiasmolithus camerunensis</i> Zone			65/67	Moshkovitz	
														NP 17	<i>Discoaster saipanensis</i> Zone	○		65/67	Takayama
														NP 16	<i>Discoaster vaui nodifer</i> Zone		○	67/67	Bilgutay et al.
														NP 15	<i>Chilparagmolithus alatus</i> Zone			69	Malumian
														NP 14	<i>Discoaster subidoensis</i> Zone			69/69	Ki Hong Chang
														NP 13	<i>Discoaster lodocensis</i> Zone	○		69	Achuthan
														NP 12	<i>Marthasterites tribrachiatus</i> Zone			69/70	El Dawoody
														NP 11	<i>Discoaster binodosus</i> Zone			70	Sadek et al.
														NP 10	<i>Marthasterites contortus</i> Zone	○	○	70/71	Shafik
														NP 9	<i>Discoaster multiradiatus</i> Zone		○	72	Sadek
														NP 8	<i>Heliolithus riedeli</i> Zone	○	○		
														NP 7	<i>Discoaster geminus</i> Zone				
														NP 6	<i>Heliolithus klempelli</i> Zone				
														NP 5	<i>Fasciculithus typaniformis</i> Zone	○	○		
														NP 4	<i>Ellipsolithus macellus</i> Zone				
														NP 3	<i>Chiasmolithus danicus</i> Zone				
														NP 2	<i>Cruciplacolithus tenuis</i> Zone	○	○		
														NP 1	<i>Markalius astroforus</i> Zone				

Table 1. Chart indicating which parts of the stratigraphic column were covered by the nannoplankton studies of UNESCO Postgraduate Course participants.

We might refrain from entering into a discussion of scientific results and reasoning. Just to give an impression as to the part of the geological time scale, which was covered by the investigations of the Vienna course members here and abroad, we might refer to the attached table 1. which should give a synopsis of the situation. Likewise plate 1. with electron micrographs of Egyptian Paleocene coccoliths, is to illustrate the type of

morphological studies performed during the last two years by some of our postgraduates; for details see explanation to plate 1. Finally we refer to the enclosed list of publications, to round out this general information.

Concluding we would like to quote a few lines from Professor Ki Hong Chang, Korea, course term 1968/69, which he has written as a general evaluation of his impressions in this field of study:

"the unique, though trivial merit of this study lies in its approach; it is to throw a new stepping stone for coming students of evolution and biostratigraphy, who want to understand the evolving world of life through nannofossils and to define stratigraphical stages according to the well substantiated evolutionary stages of nannofossils. Nannoplankton, representing a basic step towards the living things from the inorganic stage of being, might show the fundamental feature of evolution, supposedly exclusive of perplexing details."

## PLATE 1.

Transmission electron micrographs of *Prinsius bisulcus* (STR.) HAY & MOHLER.

These coccoliths were studied in detail by Dr. A. S. A. EL DAWOODY and the co-author during an investigation of Upper Paleocene nannoplankton from the Upper Esna Shale in the Gebel Duwi, Quseir District, Egypt (UNESCO Postgraduate Course 1969/70).

Fig. 1. *Prinsius bisulcus* (STR.), distal view showing the distal outer shield, the two crystal-cycles of the inner wall and the central area with six pores. Magnification: 10,600  $\times$ .

Fig. 2. Distal view of coccolith with more complicated central area. Magnification: 16,000  $\times$ .

Fig. 3. Distal view of coccolith with central area perforated by two cycles of pores. Magnification: 16,000  $\times$ .

Fig. 4. Distal view of coccolith with central area partly closed by the second, inner wall. Magnification: 10,600  $\times$ .

Fig. 5. Proximal view of a coccolith with only four perforations of the central area. Magnification: 11,700  $\times$ .

Fig. 6. Proximal view of a coccolith showing both proximal and distal shield and six perforations round a central knob. These perforations do not seem to reach the distal side of the coccolith, which there apparently is closed by cover plates. Magnification: 10,600  $\times$ .

Instrument: SIEMENS Elmiskop I of the College for Veterinary Medicine, Vienna.
