In the paper “Evaluated kinetic and photochemical data for atmospheric chemistry: Volume V – heterogeneous reactions on solid substrates” (published in Atmos. Chem. Phys., 12, 5223–5235, doi:10.5194/acp-10-9059-2010), the preferred value of the uptake coefficient for N<sub>2</sub>O<sub>5</sub> interacting with NAT surfaces (datasheet V.A5.5) is given as  $6 \times 10^{-3}$  on pages 9063 and 9208. The correct value is  $6 \times 10^{-4}$ .
